SEMESTER 2 2025/2026

SECP3106 - APPLICATION DEVELOPMENT (WBL)

SECTION 1

LAB ASSIGNMENT 1

LECTURER: DR AHMAD NAJMI BIN AMERHAIDER NUAR

STUDENT NAME	MATRIC NO
LAU YEE WEN	A23CS0099

1. Title of the Assignment

Lab Assignment 1: Daily Activities Recorder App

2. Objective

The goal of this assignment is to apply the basic Flutter development concept, specifically covering the content of Lesson 1 to Lesson 10. This includes:

- Understand the structure of the Flutter project.
- Realise the basic component and layout design.
- Use the `setState()` method to manage the application status.
- Process user text input through `TextField`.
- Use `ListView` or similar components to display dynamic data.

3. Brief Description of the System

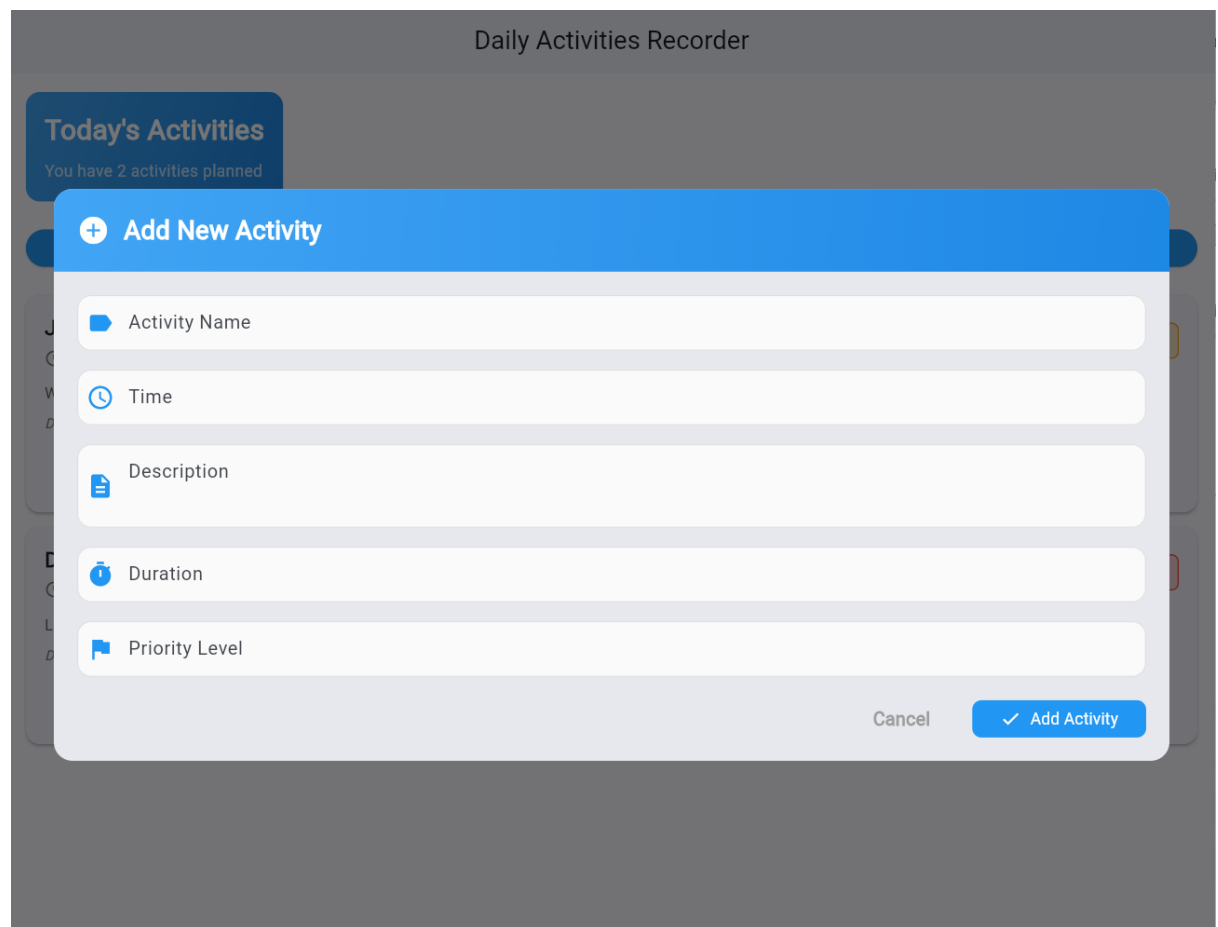

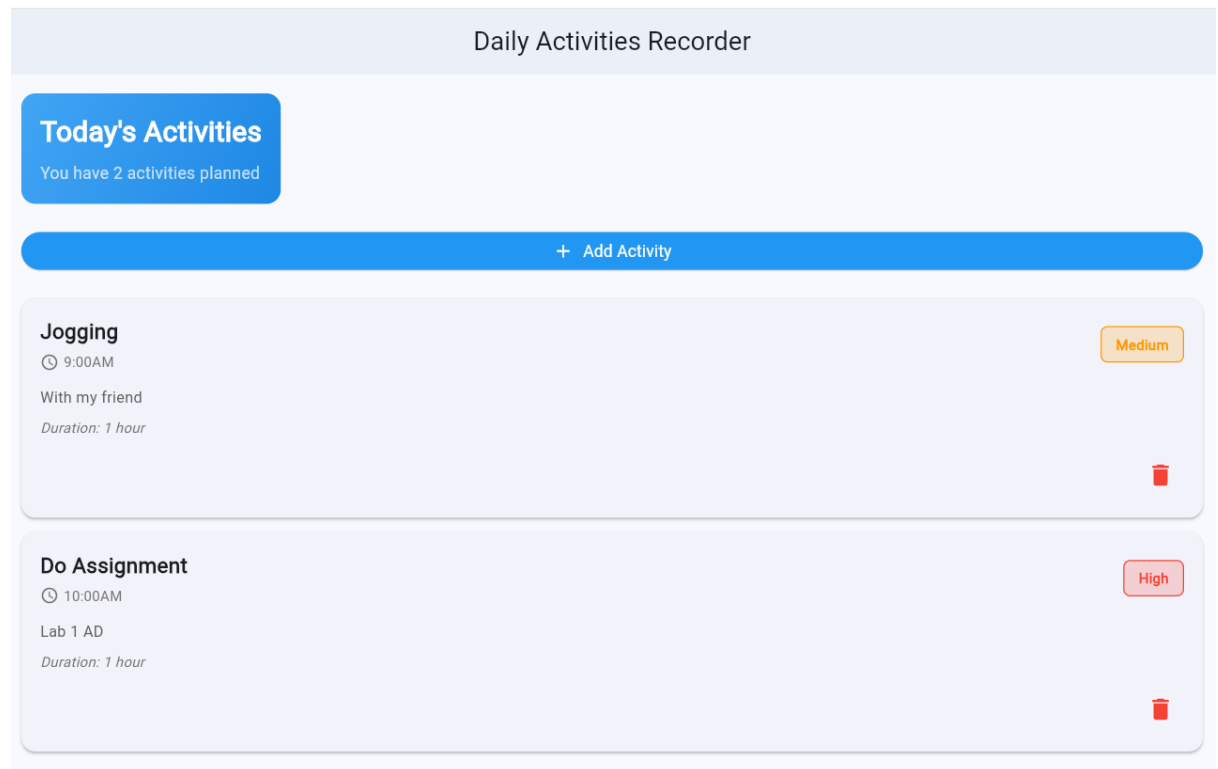

The Daily Activities Recorder App is a simple mobile application designed to help users record daily tasks. The system allows users to enter specific activity details and temporarily store this information in the state of the application. Users can view a real-time list of all recorded activities and delete individual entries when completed or no longer needed. The system focusses on simple and user-friendly interface design, while focussing on the core logic of data flow from user input to list reconstruction.

4. Explanation of the interface

The interface is designed for simplicity and clarity. The main components include:

- **AppBar:** Located at the top, displaying the title "Daily Activities Recorder" to provide relevant background information to users.
- **Summary Dashboard:** A visual card labeled "Today's Activities" that provides a quick count of the total activities currently planned.
- **Add Activity Button:** A prominent, full-width button that triggers a modal dialog for data entry.
- **Input Dialog (Modal):**
 - **Activity Name Field:** A text field for users to enter the activity name.
 - **Time Field:** A field to specify when the activity occurs.
 - **Description & Duration:** Additional fields to provide more context for each activity.
 - **Priority Level:** A field to categorize the importance of the task.
- **Activities List:** A dynamic list (`ListView`) that displays each saved activity as a card.
- **Delete Button:** A red trash icon on each activity card that allows users to remove that specific entry from the list using `setState()`.

5. Screenshots of the app

6. Conclusion

The development of the "Daily Activity Recorder" application successfully demonstrates the practical application of the basics of Flutter. By using `StatefulWidget` and `setState()`, the application can effectively manage the addition and deletion of data in real time without an external database. This task further emphasises the importance of structured component layout and state-based user interface updates in building functional mobile applications.
